

How to Get Shopify API access token

1. Install Shopify CLI (if not already):

None

```
npm install -g @shopify/cli@latest
```

2. Scaffold a throwaway app (in a scratch folder, not this repo):

None

```
shopify app init
```

- Pick a name (e.g. `token-grabber`)
- Choose the **Remix** template (default) — simplest, has built-in session storage you can inspect

In `app\shopify.server.js`, make sure the following is set to false.

JavaScript

```
expiringOfflineAccessTokens: false
```

3. Link it to your existing "MarketTest" app (optional — or just let it create a new dev app):

None

```
shopify app config link
```

This lets you pick your Partner org and either connect to "MarketTest" or create a fresh dev app.

4. Run dev mode, which handles login, tunneling, and install:

None

```
shopify app dev
```

- It'll prompt you to log into your Partner/Shopify account
- Prompts you to select which **development store** to install on (your `tn2zeq-be` / "My Store 2")
- Opens a tunnel and walks you through OAuth install automatically

5. Open a second terminal (leave this one running) and from your app's project folder run:

None

```
npx prisma studio
```

This opens a browser UI at `http://localhost:5555`. Click into the **Session** table — you'll see a row for your store with an `accessToken` column containing the raw Admin API access token (starts with `shpat_` or `shpua_`).
